- The FerryBox database contains only very few metadata, like start and stop time of every transect.
- It would be possible to create an ISO19115 and INSPIRE compliant metadata record for every transect.
- This could be done with the help of existing programmed procedures to merge static metadata with the dynamic metadata from the database developed for COSYNA.
- Possible if the data provider wants me to do it. The platform name will include a „... provided by ...“ then.
- Next slides show some examples what would be possible with the help of these metadata.
- These examples use the COSYNA data portal CODM.
- The searched parameter are proxies for Chlorophyl-a.

Abstract. From 2002 to 2005 a FerryBox system was installed aboard two different ferries travelling between Cuxhaven (Germany) and Harwich (UK) on a daily basis. The FerryBox system is an automated flow-through monitoring system for measuring oceanographic and biogeochemical parameters installed on ships of opportunity. The variables were recorded in a time interval of 10–20s, corresponding to a spatial resolution of about 100m. The data set provides the parameters water temperature, salinity, dissolved oxygen and chlorophyll *a* fluorescence. There is a longer data gap between November 2002 and August 2003 in the time series due to a change of the vessel in October 2002. The data are available at <https://doi.org/10.1594/PANGAEA.883824> (Petersen et al., 2017) and as part of the COSYNA (Coastal Observing System for Northern and Arctic Seas) data portal CODM at <http://codm.hzg.de/codm> (last access: September 2018) or <https://doi.org/10.17616/R3K02T> (Breitbach, 2018).

How to cite: Petersen, W., Reinke, S., Breitbach, G., Petschatnikov, M., Wehde, H., and Thomas, H.: FerryBox data in the North Sea from 2002 to 2005, Earth Syst. Sci. Data, 10, 1729-1734, <https://doi.org/10.5194/essd-10-1729-2018>, 2018.

To dos and outlook

- Adapt HZG opendap export to new OceanSites format together with BSH.
- More usage of quality assurance tools of the database.
- Enhanced FerryBox metadata usage is possible.
- Import of additional routes (SMHI, AWI, ...)
- HZG will bundle the various data from COSYNA (Coastal Observing SYstem for Northern and Arctic seas), coastmap (water and sediment samples, model visualization tools from an array database) and coastdat (50 year reanalysis data for the North Sea) into a common Helmholtz Coastal Data Center (HCDC).
- Together with OSIS (Geomar) and O2A (AWI) HCDC will build up the Data Mare Hub the core of the coming NFDI4EARTH in Germany.

Thank you
